Re: Rack Decommissioning Technician — Data Center Operations

Dear Hiring Team,

I am applying for the Rack Decommissioning Technician position. My experience spans physical telecommunications infrastructure, hardware diagnostics, asset and inventory control, endpoint lifecycle management and controlled enterprise change.

In my current Australia Post role, I manage equipment from preparation and imaging through Autopilot/UEM enrolment and compliant disposal with data sanitisation. I diagnose and repair devices, manage loan equipment, maintain spares and accessories inventory, review stock watermarks, and record/escalate complex faults through ServiceNow. This has reinforced the importance of accurate asset handling, repeatable procedures and clear completion records.

Earlier, at National Broadband Network, I installed and maintained infrastructure equipment, ran physical cabling and performed Layer 1 fault-finding across residential and commercial environments. In my concurrent Senior Engineer role supporting the Department of Education Victoria, I execute critical changes and patching for 660,000+ users, produce RCA and as-built documentation, and operate with 99.9% uptime expectations.

I would bring AWS a careful, safety-minded approach to rack and equipment work, backed by strong ITSM discipline and the ability to investigate issues when a decommissioning task does not proceed as expected.

Yours sincerely,

Sam Ludwig
