

Dear Commonwealth Bank hiring team,

I'm applying for the Senior Platform Engineer role. My engineering background combines enterprise cloud operations, Microsoft identity and collaboration platforms, automation, and high-volume production support.

Supporting the Department of Education Victoria, I worked within an environment serving more than 660,000 users and managed critical Microsoft 365 and SharePoint services with 99.9% uptime. I built automation to audit and enforce MFA compliance, supported Azure cloud adoption and legacy remediation, resolved hybrid identity and authentication failures, and integrated ServiceNow with live Microsoft 365 presence data to improve ticket allocation and prevent SLA breaches.

I also delivered Azure DevOps CI/CD pipelines for SharePoint solutions, reduced deployment cycles by 25%, and created PowerShell and Python tooling that cut migration processing time by 87%. My focus is on reusable engineering paths, clear operational documentation, and eliminating recurring toil through automation and root-cause analysis.

CBA's focus on secure, reusable platform services and self-service engineering aligns with the kind of work I'm seeking. I'd bring hands-on implementation skills, strong production discipline, and a practical understanding of identity, security, and enterprise service reliability.

Kind regards,

Sam Ludwig
