

Dear hiring team,

I'm applying for this field technician opportunity because I'm looking to move toward practical, hands-on technical work involving equipment, infrastructure, troubleshooting, and continual skills development.

My background combines physical infrastructure and enterprise technology. Earlier in my career with NBN, I performed Layer 1 telecommunications deployments, physical cabling, and fault-finding across residential and commercial environments. More recently, I managed hardware provisioning, endpoint lifecycle, Windows imaging, Autopilot enrolment, Intune policy deployment, and post-deployment validation in enterprise and live healthcare environments.

I'm comfortable working methodically from symptoms to root cause, following safety and change procedures, documenting work clearly, and communicating with customers or operational teams when an issue affects service. I also bring strong diagnostic automation experience in PowerShell and Python, which helps me work efficiently without losing attention to physical detail.

This role appeals because it offers a more tangible connection between the work performed and the equipment or infrastructure being maintained. I'm particularly interested in structured training and building specialist capability over time. I'm an Australian citizen, available immediately, and willing to complete the required background checks, assessments, and role-specific training.

Kind regards,

Sam Ludwig
