

Dear PaperCut hiring team,

I'm applying for the Senior DevOps Engineer role in Camberwell. My background is in building and operating Microsoft cloud and collaboration environments, with a strong emphasis on automation, reliability, and root-cause improvement.

In my recent role supporting the Department of Education Victoria, I worked across a Microsoft 365 environment serving more than 660,000 users. I handled complex Tier-3 escalations, supported Azure cloud adoption and legacy remediation, administered hybrid identity and Exchange environments, and built PowerShell automation that reduced repetitive operational work. Through structured RCA and documentation, I helped reduce repeat incidents by 15%.

Earlier, I delivered Azure DevOps CI/CD pipelines for SharePoint solutions, reducing deployment cycles by 25%, and built PowerShell and Python tooling that reduced migration processing time by 87%. These projects reflect how I work: make the system observable, automate the repeatable path, and improve the operational baseline rather than repeatedly treating symptoms.

PaperCut's engineering culture and Camberwell location are particularly appealing. I'd bring practical cloud, automation, and production-support experience to a team that values high-quality engineering and measurable outcomes.

Kind regards,

Sam Ludwig
