

Dear Westbourne Grammar hiring team,

I'm applying for the Infrastructure, Azure & Security Engineer role. My experience spans Microsoft 365, Azure, hybrid identity, endpoint management, automation, and security uplift across large and operationally sensitive environments.

At the Department of Education Victoria, I supported a SharePoint environment serving more than 660,000 users with 99.9% uptime. I acted as a Tier-3 escalation point, managed Active Directory and Entra ID synchronisation, administered Exchange Hybrid and Teams, and supported Azure cloud adoption and legacy remediation aligned with ACSC Essential 8 principles. I also engineered PnP PowerShell automation to audit and enforce MFA compliance across more than 200 SharePoint sites.

My endpoint experience includes Windows 11 migration across 100+ clinical devices, with Autopilot provisioning, Intune policy application, post-deployment validation, and hypercare in a live healthcare environment. I'm comfortable balancing security controls with operational practicality, documenting changes clearly, and working directly with stakeholders when an issue affects teaching, clinical, or business operations.

The combination of infrastructure ownership, Azure, security, and an education setting makes this role a strong fit. I'd welcome the opportunity to help Westbourne maintain a secure, reliable, and well-managed technology environment.

Kind regards,

Sam Ludwig
